and refined turbine design technology, which is a research hot spot in recent years. Chapter 7 introduces the application of flow control technologies in turbines, including control of turbine boundary layers, secondary flows and tip leakage flows, and turbine working state adjusting technology, which is also a research hot spot in recent years.

COOLED TURBINE AERODYNAMICS The turbine inlet temperature of airbreathing gas turbine-engines has continually increased over the past years and will continue to increase (fig. i) in the years to come. This has been made possible by advances in both material technology and the use of advanced turbine blade cooling techniques.

The magnitude and distribution of this force is the primary focus of wind-turbine aerodynamics. The most familiar type of aerodynamic force is drag. The direction of the drag force is parallel to the relative wind. Typically, the wind turbine parts are moving, altering the flow around the part.
